

Student Journey Autopilot

Today the same student lives in six tools and a person copies them between each one. Leads get dropped and access gets granted late. **One n8n workflow now carries every handoff**, and a separate alert workflow speaks up the moment any step fails.

Opt-in line Enrollment line Replay line Error layer

Error layer: nothing fails silently

separate workflow · Error Trigger + daily schedule

Retry 3× on every API call

3 seconds apart, which absorbs rate limits and brief outages without anyone noticing.

Slack + email alert

Names the tool, the failing step and the API error, with a link to the exact run.

Safe one-click retry

Every write is an upsert or deduplicated (Klaviyo unique_id), so rerunning never double-sends.

Loud on bad config

A new product with no course mapped, or a tag with no list, raises an alert instead of dropping the student.

7:30 am health check

Tests all four credentials daily and warns before an expired token reaches a real signup.
